HUNTING PARK AVENUE at 18th STREET, PHILADELPHIA 32, PA., and COURT HOUSE SQUARE, CLINTON, IOWA

Cable Address — "Burpee" Philadelphia

Dear Fellow Gardeners:

Gardening is now on a peacetime basis. Gardening is the most peaceful of all pursuits. It is the most popular of all sports. It is enjoyed by far more people than hunting, fishing, baseball, football or golf. Tilling the soil is the most essential of all human activities.

Without the products of the soil, neither man nor beast could live. It is nice to contemplate that this most essential activity is the source of so much pleasure, recreation and health to so many people.

Vegetable gardening is most important now. We must ship large quantities of food to the unfortunate people of Europe, including children, who will starve this year if they do not receive food from us. We cannot produce enough food, but every vegetable you grow will help.

As relief from the strain and sadness of war, there has developed a very widespread demand for flowers. This is encouraging as it is a signpost pointing toward the better things of life. Flowers have a refining and uplifting influence upon all who grow them or behold them. Every child should have the benefit and pleasure of flower gardening.

It will be another year at least until enough flower seeds are available to meet all demands. We believe that we have the largest and finest supply of flower seeds in the entire world. But we ask that you order early.

Whenever you order, it will be our pleasure to supply you promptly with seeds that will grow the best vegetables and flowers. We hope you will grow both.

May you always have a successful garden and may your life increasingly be full of happiness is my earnest wish.

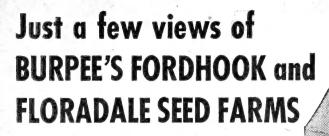

Faithfully yours,

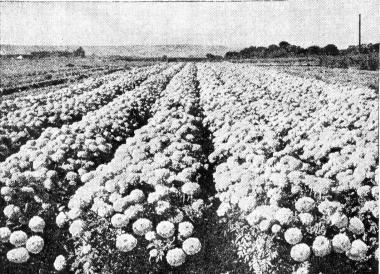

David Domp

President

BURPEE'S HYBRID VEGETABLES

All created on Burpee's Fordhook Farms

Last year when we introduced Burpee Hybrid Cucumber and Fordhook Hybrid Tomato, we had no way of telling how great the demand for them would be. Their value, however, was quickly recognized and to our surprise the early customers bought up the entire supply of seed long before the planting season started. We think we have enough seed of all three Hybrids offered below, but we cannot be sure, so we advise that you order early.

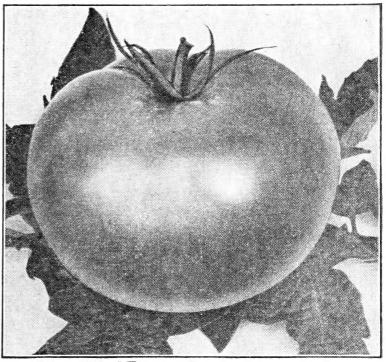

1132 Burpee Hybrid Tomato

NEW FOR 1946

70 days. Early-midseason hybrid particularly outstanding for the quality and rich flavor of its fruits. It is a great producer, yielding 20% more than Marglobe or Rutgers.

Fruits are medium to large, firm, thick walled, average 8 ozs. in weight, deep globular in shape, scarlet-red in color; flesh is meaty and so rich in flavor that other popular varieties seem flat in comparison. A valuable maincrop tomato for the home garden, market grower and long-distance shipping.

1121 Fordhook Hybrid Tomato

60 days. Early, highly prolific hybrid noted for its uniformly shaped smooth fruits which are of medium size, average 6 ozs. in weight, oblate to globular in shape, even red in color and mildly acid sweet in flavor.

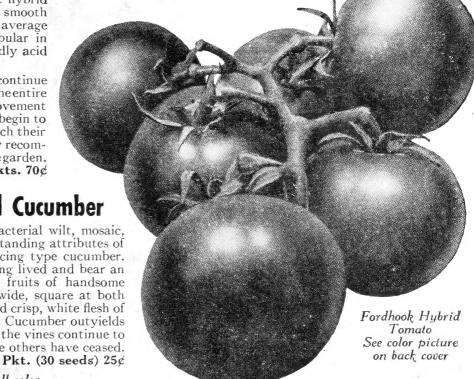

Plants begin to bear early and continue to produce profusely throughout the entire season. This is a decided improvement over the standard varieties that begin to bear early but in a short time reach their peak of productivity. Especially recommended for early market and home garden.

370 Burpee Hybrid Cucumber

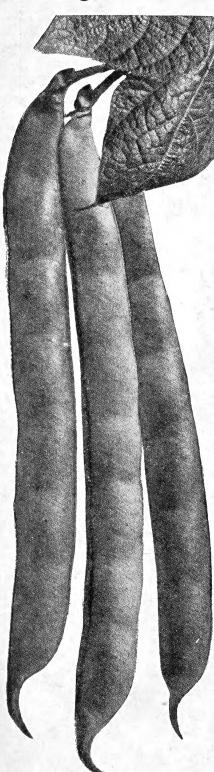

60 days. High resistance to bacterial wilt, mosaic, and downy mildew are the outstanding attributes of this new hybrid white spine, slicing type cucumber. Vines are extremely vigorous, long lived and bear an abundance of well-formed green fruits of handsome appearance, 8 in. long, 2½ in. wide, square at both ends with medium seed cavity and crisp, white flesh of excellent quality. Burpee Hybrid Cucumber outyields open pollinated varieties because the vines continue to produce their fruits long after the others have ceased.

Stringless Green-Pod BUSH BEANS

Burpee's Stringless Green-Pod

Before the introduction of stringless bush beans, the green as well as the yellow podded varieties were popularly known as string beans and this name, unfortunately, seems to remain in many localities. Now that strings and tough fiber have been bred out of these varieties, we are referring to them as snap beans. Take a pod, green or yellow, break it quickly and see how it snaps. Pods are most delicious, raw or cooked, if picked when quite young and tender—never wait until they have reached full size.

10 Burpee's Stringless Green-Pod⊙

49 days. Attractive, round green pods about 6 in. long, slightly curved and so thick, even when quite young, as to be double-barreled. Always tender, brittle, meaty, juicy, entirely stringless and of the finest flavor. The plants are medium-large, spreading, with dark green foliage; they are of strictly bush form, enormously productive and have yielded remarkably well under adverse conditions. Seeds are a dark coffee-brown color. A favorite green-pod, bush snap bean for home use, canning, freezing and commercial planting.

Plant seed when danger of frost is past and the soil is quite warm, in rows 18 to 30 in, apart for hand cultivation or $2\frac{1}{2}$ to 3 ft. apart for field cultivation. Make furrows about 2 in. deep and space the beans 2 to 3 in. apart in the row. Cover with fine soil and firm the soil over the seed with your foot or the back of a rake to insure good germination. When plants are 2 or 3 in. high, thin to stand 4 to 6 in. apart in the row. For a continuous supply of tender pods, make additional sowings when the preceding planting is up and growing; allow plenty of time for the last sowing to bear before frost. Plants grow 15 to 20 in. tall. A pkt. of seed will sow about 25 ft. of row; one lb., 150 ft.

o Follow the Bull's Eye o

We have used this mark O for years to guide the gardener in the selection of vegetable varieties which we believe will give the best results under varied conditions of soil and climate. This mark Q, usually called a bull's eye, was used by the ancient alchemists to represent gold. It therefore is most appropriate for indicating the varieties which we consider the best of their class. If you are not thoroughly posted which varieties to choose as the most suitable for your particular section, we suggest that you make your selection from those marked with the bull's eye. They are reliable.

BUSH SHELL BEANS—may be used either green or dried

Many varieties of pole beans, listed on page 7, are also desirable as shell beans.

How to Grow POLE BEANS

Pole Beans come into bearing later than bush varieties, bear more héavily Pole Beans come into bearing later than bush varieties, bear more heavily over a longer period, and some varieties produce bigger pods. They are less hardy, however, so should not be planted until all danger of frost is past and the soil is warm and moderately dry. They do best if the vines are given support, the most frequently used being rough poles. Place 5 to 8 beans around each pole, cover with 2 in. of soil, and firm to assist germination. When plants are well started, thin so that 3 or 4 of the strongest remain to a pole. A packet of seed is enough for 15 poles; 1 lb. of seed for 100 poles. Pole Beans may also be planted along a trellis or fence, sowing 300 ft. of row with 1 lb. of seed.

CHICORY—Delicious, appetizing salad

297 Witloof (French Endive) 110 days. A choice salad delicacy for fall and winter. Sow seed in the spring. In early fall, cut off foliage 1 in. above soil level, cover with 8 to 10 in. of soil and keep in place with boards set along the sides for three or four weeks when a pure white blanched stalk should be ready. Cut off about 1 in. above the top of the root and repeat as above for a second crop, after which, if wanted during the winter in cold sections, dig the roots, store for a few days in a shed or pit so they may become thoroughly chilled, then place upright in boxes and cover with 10 in. of sand, light soil or peat moss. Water and keep in a warm place indoors. In about a month, the sprouts slbould break through the surface and be ready for use again as a delicious salad.

How to Grow BUSH LIMA BEANS

Bush Lima Beans succeed well in almost any good garden soil but do best in a rich, well-drained, sandy loam. As seed is sensitive to cold and wet ground, it must not be planted until the soil has become quite warm and fairly dry. Plant the seeds edgewise, eye down, 5 in. apart in rows 2½ to 3 ft. apart, and cover with 2 in. of fine soil. When the plants are well started, thin to stand 12 to 15 in. apart for large-seeded varieties and 9 to 12 in. for small-seeded varieties. Give frequent and shallow cultivation until blossoms appear, but do not cultivate or handle plants when they are but do not cultivate or handle plants when they are wet. A pkt. of large-seeded varieties will sow 15 ft. of row; one lb. 100 ft.; the small-seeded kinds will, of course, go much farther.

Pole LIMA BEANS

Pole Lima Beans mature somewhat later than bush limas and must be given support on which the vines may climb. The yield per sq. ft. of garden space is about the same as that for bush limas or slightly larger. Some persons prefer the flavor of pole limas to the bush varieties, some like the thick or "potato" type (Burpee's Best), others the flat (Burpee's Improved Giant Podded), some large, some small; all are good—it's a matter of individual choice and for what purpose intended,—to be eaten green, dried, canned or quickly frozen. to be eaten green, dried, canned or quickly frozen.

Burpee's RED BEETS

Beets are easily grown and may be enjoyed as baby beets when roots are half grown or they may be used from then on until they reach their full size. The tops are highly palatable when cooked alone as "greens' or young beets with their tops may be cooked together. Burpee's Red Ball, Detroit Dark Red and Crosby's Egyptian are universally popular. Spinach Beet (Swiss Chard) is grown exclusively for the use of its tops as "greens"; it is offered separately on page 40.

Compact plants, 20 in. tall, with solid, round, cabbage-like sprouts measuring 1¼ to 1½ in. in diameter with a more delicate flavor than cabbage.

The "sprouts," dark green, tightly folded, cabbage-like heads, appear along the central stalk at the joints of the leaves and appear first at the bottom of the stalk. Cover with ½ in. of fine soil. Thin the small early varieties to stand 2 in. apart in the row and the larger, later varieties from 3 to 4 in. A rich, mellow, deeply worked soil gives the finest carrots. The later sowings will produce nice, tender carrots in the fall and the best for winter storing. A pkt. will sow about 30 ft. of row; an oz. about 200 ft.

BURPEE'S CAULIFLOWER

Heads should be used as soon as they fill out, otherwise they will lose in quality and break. tions on our Floradale Farms and is the equal of that grown anywhere.

How to Grow CAULIFLOWER

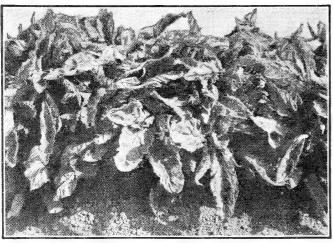

Cauliflower is best grown as a fall crop in the greater part of the United States, although in regions where summers are reasonably cool, sowings may be made indoors or under glass, 30 to 40 days before it is time to set plants in the garden. For a main or fall crop, sow the seed in a specially prepared seed bed or cold frame about 4 months before your first expected frost. When plants are ready to be set in the garden, space them 1½ to 2 ft. apart, in rows 2½ to 3 ft. apart. A packet of seed will produce about 150 plants; 1 oz. 4000 plants. Burpee's New Vegetable—TAMPALA

BETTER THAN SPINACH—STANDS HOT WEATHER

Young Tampala plants make the most delicious "greens"

1377 Burpee's Fordhook Tampala

New for 1946. The darkest green-leaved selection of this newly recognized vegetable which has been accepted as a "must" in every summer garden. Fully described on the opposite page. Pkt. 25¢; 2 pkts. 45¢; ½ oz. 60¢; ½ oz. \$1.00; oz. \$3.00

1375 Burpee's Tampala

First offered by us in 1944 as a delicious green vegetable, the leaves of which are cooked, prepared and served like spinach but is better than spinach in many important respects.

Tampala is so different in flavor from other vegetables used as "greens" that it is difficult to compare it to any of them. It retains its tenderness for a longer time, has a consistency and flavor all its own, less tinny and less puckery than spinach, more flavor, more body, and more food value than either spinach or chard—a pleasing change from all other "greens." It does well in hot weather and will keep on producing all summer.

Our second selection offered in 1945 and equal in all respects to Burpee's Tampala, listed above, but instead of the leaves being green they are variegated green and red, the red extending out along the veins of the dark green leaves whose underside also is red. When cooked, prepared, and served like spinach it is most delicious.

Tempting Ways to Use Tampala

CHEESE TAMPALA SOUFFLÉ

1 tsp. chopped onion ½ cup milk ¼ cup grated cheese 2 tblsp. fat ¾ tsp. salt 3 eggs, separated 2 tblsp. flour ½ tsp. pepper 1 cup chopped, cooked Tampala

Sauté onion in fat until slightly yellow. Stir in flour and gradually add milk. Cook, stirring constantly, until thickened. Add cheese and seasonings. Place over hot water in double boiler; stir until cheese melts. Beat the egg yolks thoroughly and add with Tampala to cheese sauce, then fold in stiffly beaten egg whites. Turn the soufflé into a greased casserole and set in a pan of hot water. Bake in a moderate oven, 350 F., for about 50 minutes. Makes 4 servings.

TAMPALA RING

4 cups cooked Tampala 4 tblsp. butter or bacon drippings 34 tsp. salt 3 cups cooked carrots and celery

Drain Tampala thoroughly. Chop fine and season with butter and salt. Press firmly into greased ring mold and place in slow oven, 250° F., for 20 minutes. Unmold ring onto chop plate. TAMPALA WITH HOT BACON DRESSING

6 strips bacon 1 tsp. salt ½ cup sugar ½ cup water 2 tblsp. flour ½ cup vinegar

1 tblsp. lemon juice 4 tblsp. bacon fat

Fry bacon until crisp, drain fat and measure ¼ cup. Mix dry ingredients, add to liquids and bacon fat. Cook in top of double boiler seven minutes until smooth. Add half of crisp bacon to dressing.

Put fresh cleaned, cut Tampala (about one pound) into large kettle and toss lightly with hot bacon dressing over fire four or five times. Serve at once, using rest of bacon as a garnish.

TAMPALA SALAD

Select tender leaves from Tampala stalk and wash thoroughly. Roll into firm bunch and cut with a sharp knife into very thin shreds. Also cut two medium-sized onions into thin rings. Toss onions and Tampala together lightly with French dressing, also salt and pepper. Garnish with onion rings or sieved egg yolk.

Tampala leaves or shredded Tampala both make nice underliners for molded or tart salads. Tampala won great favor in our kitchen.

Burpee's Fordhook Tampala BETTER THAN SPINACH

1377 Fordhook Tampala is our new, selected strain of this remarkable green leaf vegetable being offered for the first time this year.

Fordhook possesses all the good culinary qualities of Burpee's Tampala and Burpee's Red Tampala and, in addition, has darker green leaves. As the deep green color is retained when leaves are cooked, prepared and served like spinach, many home gardeners will prefer Fordhook Tampala, as will those who wish to can or freeze it. Tampala also makes an excellent baby food when strained.

Tampala, as a cooked, canned or quickly frozen green, is, in the opinion of many, far superior to spinach or Swiss chard. Its color is more appetizing, its flavor more delicious, shrinks very little, holds its color better and requires less cleaning and washing when preparing the leaves. There are many interesting ways to prepare Tampala; a few tested recipes are given on the opposite page. We know you will discover other ways to serve this delicious vegetable.

Tampala is a so-called hot-weather plant doing best when days are long. Seed, then, should not be sown until the ground has become warm. Within 6 to 8 weeks from sowing, Tampala is ready to use when entire plants make the most delicious greens, raw as a salad or cooked as you would spinach.

For a continuous supply of the most tender leaves, make several successive sowings 10 days to 2 weeks apart and use young plants when 6 to 10 in. tall. However, a plant may be left every 2 ft. and leaves picked as they mature or 4 to 5 in. tips of each branch may be quickly gathered instead of picking individual leaves. These young stem tips and leaves may be cooked together, but for the best eating, we suggest that you separate stems and leaves.

So tender are the leaves, that they require only 5 minutes to cook, with just the water that clings to them when washed. Stems are cooked like asparagus for 8 to 10 minutes, or a little longer, depending on size; they have a flavor suggestive of artichokes.

Burpee's CELERY

A most popular vegetable served raw as a relish or cooked in different ways. May be used from the time plants are one-half or two-thirds grown until fully matured. Stalks may be blanched to make them more crisp and tender, although many persons prefer them unblanched, especially Burpee's Fordhook, Giant Pascal, and Utah, all famous green celeries. Some varieties, such as Burpee's Fordhook, are highly desirable for winter storage either where grown and protected from freezing or lifted and put in soil in a cold cellar. lifted and put in soil in a cold cellar.

Famous for Tenderness and Flavor

130 days. Burpee's Fordhook Celery is, without question, the best fall and winter variety in existence. Plants are stocky and compact, growing 15 to 18 in. tall. Although comparatively dwarf, they are so solid that they weigh fully 2 lbs. each. Their limited height is of great importance, since the plants are by far more easily blanched than those of the taller varieties. The stalks, after blanching, are a beautiful pure silvery white with a large, tightly folded full heart of the most delicious flavor. Always tender, crisp, without strings, and juicy. The time of maturity and the dark green color before blanching make Fordhook an ideal variety for winter storage. We offer our improved strain. Pkt. 20¢; ½ oz. 75¢; oz. \$1.35; ¼ lb. \$4.00

How to Grow CELERY

For the earliest crop, start the seed in a hotbed or in the house, For the earliest crop, start the seed in a hotbed or in the house, allowing 10 to 14 weeks to produce plants large enough to set out when weather gets warm. For the fall or main crop, sow seed in the open ground as early in the spring as the soil can be worked into good condition. Cover seed with no more than ¼ in. of fine soil. Celery requires a rich, well-manured soil and plenty of moisture for best results. Soil, boards, or celery paper may be used to blanch the stalks. A pkt. of seed will produce about 400 strong plants; 1 oz. about 7500 plants. Days to maturity are from field setting of plants.

Burpee's Hybrid SWEET CORN

Hybrid Corns are of special value to market growers and canners and many home gardeners because the ears from one planting mature at about the same time; in addition to this uniformity of maturity they are noted for their high yield and resistance to Stewart's disease or bacterial wilt. If you prefer to pull ears from one sowing over a longer period, plant open pollinated or standard varieties listed on the following two pages. Seed saved from hybrids will not come true to type the following year and for that reason you must get new seed each year.

How to Grow SWEET CORN

Plant seed after all danger of frost has passed and the soil has become thoroughly warm in rows $2\frac{1}{2}$ to 3 ft. apart, spacing the seeds 4 to 6 in. apart in the row; cover with 1 in. of soil and later thin to stand 9 to 12 in. apart. Some prefer to sow 5 or 6 seeds in groups, allowing 2 to 3 in. between the seeds and spacing the groups 2 to 3 ft. apart in the row; allow 2 to 4 plants to remain in each group, depending on the fertility of your soil. For a continuous supply, sow varieties which mature in succession; also make additional sowings when the preceding planting is up and well started; allow enough time for your last planting to mature before the first expected frost in your locality. Corn should be planted in blocks of at least 4 rows side by side rather than in a single long row, to insure pollination and the development of a full set of kernels. A pkt. will plant 4 rows, each 25 ft. in length; 1 lb. will plant 300 groups or so-called "hills."

To enjoy Sweet Corn at its best, it should be eaten as soon as possible after ears are pulled; any delay causes loss of sweetness and quality. At what stage to pull corn is a matter of choice, although most persons prefer the ears in milk stage if to be eaten from the cob. For corn fritters or other dishes, ears may be more matured. Whether you grow yellow or white grained corn is a matter of preference as is the selection of hybrids or open pollinated varieties.

Sow seed as early in the spring as the ground can be worked, in rows 1 to 1½ ft. apart. Cover the seed lightly. If fully matured onions are wanted, thin the seedlings when 3 to 4 in. tall, to stand sufficiently far apart to develop without touching one another. When the bulbs have reached maturity, bend down the tops to hasten ripening before the onions are harvested. Store in a dry, free-from-frost place over winter. Wrinkled-seeded peas, both early and main crop varieties, are favored by many home gardeners, as well as market growers and canners, because of their extra sweetness and better quality. Contrary to popular belief, they can be planted as early as smooth-seeded varieties—as soon as soil can be prepared, but do not sow in cold, wet ground.

How to Grow PEAS

Peas make their best growth during cool weather so that the first planting of seed should be made as early in the spring as the soil can be worked. Sow an early variety two or three times at 10-day intervals or choose from the smooth-seeded early, wrinkled-seeded early and main-crop varieties. Sow again in late summer for a fall crop. Planting space available more or less governs the number of sowings and the choice between tall and dwarf varieties. Peas are usually planted in double rows 3 in. apart, the seeds dropped 2 in. apart and covered with 1 to 2 in. of soil. Double rows should be spaced about 2½ ft. apart. Provide supports for the tall-growing varieties. A pkt. will sow 20 ft. of row; 1 lb. 100 ft.

EDIBLE-PODDED or SUGAR PEAS (COOK LIKE SNAP BEANS)

Sugar Peas possess the tenderness and fleshy podded qualities of a snap bean and the flavor and sweetness of fresh green peas. When young, the peas are not shelled but the pods are cooked like snap beans. At this stage, pods are stringless, brittle and succulent. Should pods develop too fast for use as snap beans, seeds may be eaten as shelled peas and are of the best flavor before they have reached full size. The following varieties are entirely free of fiber or parchment. Vines should be given support of string or brush to climb upon for best results.

They not only mark the row where the slower-growing vegetables were sown, but often are usable before the companion crops have made any sizable growth. For this purpose, use the earliest varieties.

TETRA SNAPS-New for 1946

Giant Ruffled Tetraploid Snapdragons

A Few are Pictured in Color on the Front Cover of this Catalog

1576 **Superfine Mixture** The largest flowered of all snapdragons, 2 to $2\frac{1}{2}$ in. deep and $1\frac{3}{4}$ to $2\frac{1}{4}$ in. wide, many distinctly and attractively ruffled; every color seen in this glorious flower, plus some new ones. There are shades and variations of bright orange, light orange, peachorange, rose-orange, bronzy yellow, golden yellow, canary yellow, yellow-flecked red, antique bronze, reddish bronze, orchid, scarlet-tipped yellow, scarlet, crimson, pinks from apple-blossom to deep rose, pink-flushed yellow, pink and white combination, pure white and others of harmonious tone blendings; a most unusual and pleasing mixture—an exciting new snapdragon mixture for your 1946 garden.

Tetra Snaps are a new "scientific" creation—a new group of snap-dragons originated through the treatment of the best diploid varieties with colchicine—a drug or chemical derived from the bulbs of fall crocus.

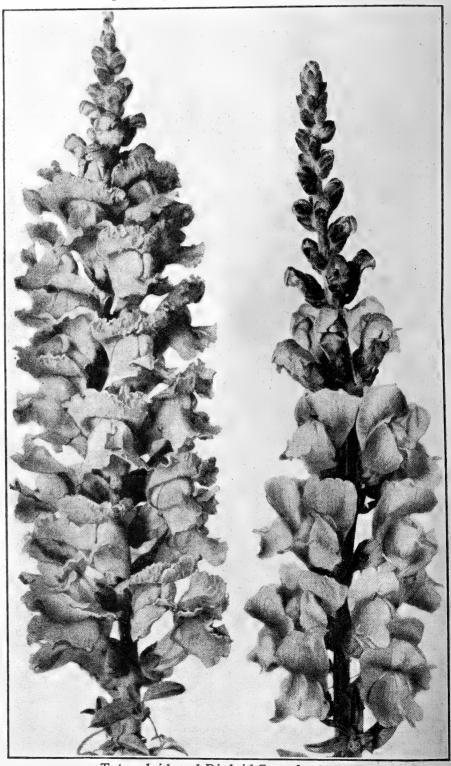

Genetically, Tetra Snaps are known as tetraploid snapdragons for, when examined under the microscope, one finds that they have twice the number of chromosomes (the "container" of hereditary "genes") in their cells as regular or diploid varieties.

The doubling of the chromosomes not only produces plants with larger flowers, but the plants themselves are stronger and huskier, trifle taller than diploids with glossy, dark green foliage, thick and almost leathery in texture; the stems, too, are stouter. All these desirable features have been obtained without sacrificing any of the noteworthy characteristics that have made snapdragons so popular.

Under general field conditions the central spikes average $2\frac{1}{2}$ ft. in height; these are surrounded by lateral spikes of lesser height. Plants are base branching so that long-stemmed flowers are assured for cutting. We have counted more than 60 buds and blossoms on one spike with as many as 25 flowers in full bloom at one time. These flowers are of heavy substance, which adds to their keeping value.

For several years we have selected the most cheerful and desirable colors, the largest flowers and the best spikes for this carefully blended mixture of tetraploid snapdragons—tetra snaps for short. Our fields of thousands and thousands of plants in a riot of colors, were really a sight to behold; to quote one of our men in charge of seed production "people came time and time again just to awe at them." They will be admired in your garden or home too.

Burpee's Annual Larkspurs

One of the most beautiful and desirable flowers for the garden and cutting.

One of the most beautiful and desirable flowers for the garden and cutting. Easily raised, quick growers, and very free flowering; produce a wealth of large, double blooms on long, attractive spikes. Even the deep green, finely divided foliage is pretty when plants are not yet in bloom. We offer your choice of three distinct types.

The culture of annual larkspur is quite easy. They do best in a sunny position, in rich, well-drained garden soil free from fresh manure. As they like cool weather in which to germinate and to grow best, seed should be sown as early in the spring as the ground can be worked—the earlier, the better—but do not sow in cold, wet ground. We suggest sowing seed where plants are to bloom, as they sometimes resent being transplanted. When seedlings are large enough to handle, thin them to stand 1 to 1 ½ ft. apart. When seedlings are large enough to handle, thin them to stand 1 to 11/2 ft. apart.

We offer three distinct and desirable colors, each of which received an award in the All-America Selections.

Early Flowering SWEET PEAS

Burpee's Early Flowering Sweet Peas come into bloom outdoors before the summer heat arrives —3 to 4 weeks earlier than the Giant Spencer varieties. They are valuable for winter flowering under glass, also especially adapted for growing in frost-free sections and for earliest blooms outdoors in the North. Sweet Peas do best in cool weather. If seed was not sown in the fall, sow as early in the spring as the ground can be prepared. They prefer an open, sunny location, and deep, rich soil which must be well drained.

We have marked with a star (*) the varieties that we prefer in each color class; if you are in doubt as to which to choose, make your selection from those thus marked. All, however, are lovely and desirable. In each color class, we have arranged varieties from deep to light shades.

BURPEE'S Perennial Flower Seeds

Perennial Flowers are the hardy permanent ones that live for years. Plants grow to the flowering stage each year and die down again to the roots, which remain alive but dormant until the next season. Some perennials will flower the first year from seed if it is sown early, although two seasons are usually required before the plants produce their blooms.

Perennials are most important flowers in the garden. With proper selection they can be had in bloom from early in the spring until late in the fall, beginning with the showy golden Alyssum saxatile compactum, Siberian Wallflower, Columbine, and many others, ending the season with the fall Chrysanthemums. Cultural directions are given on every bag. The Burpee leaflet L 26, "Perennials from Seed," will be sent free upon request.

With the perennials, we have included the best of the biennials, seed of which is sown one year, the plants blooming the second season, after which they die.

> Average heights and blooming season are given in the descriptions. Some variation is natural in different localities.
